

IKEA Global Product Catalog Analysis (2026)

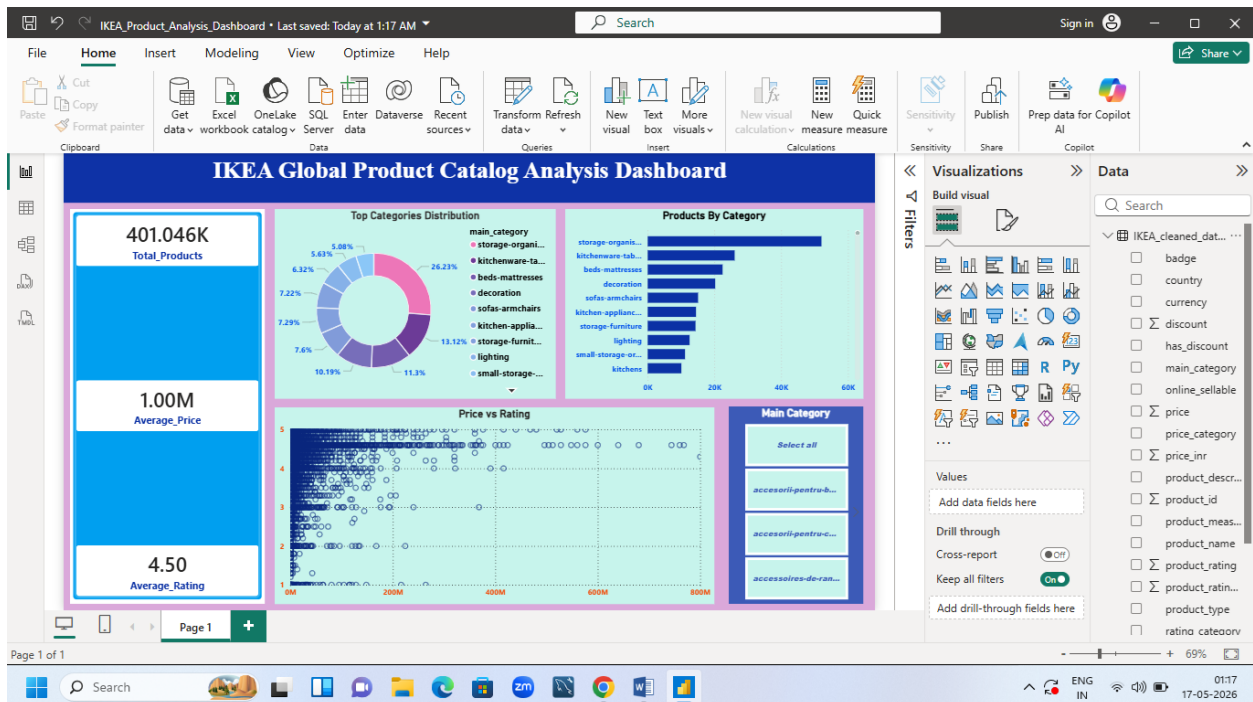

Stage 4 – Documentation, Insights and Presentation

1. Dashboard Overview

An interactive Power BI dashboard was created using the cleaned IKEA dataset. The dashboard was designed to visually represent important business insights related to product categories, pricing, and customer ratings.

The dashboard contains:

- KPI Cards
- Donut Chart
- Bar Chart
- Scatter Plot
- Slicer for category filtering

The charts were properly aligned and formatted inside Power BI to improve readability and user interaction.

2. Summary of Findings

The analysis shows that IKEA contains a large number of products across different categories. Storage organization and kitchen-related products have the highest product counts compared to other categories.

Most products are available in affordable and medium price ranges. Only a few products belong to very high price ranges.

Customer ratings are generally high, with most ratings falling between 4 and 5. This indicates that customers are mostly satisfied with IKEA products.

The scatter plot analysis shows that expensive products do not always receive higher ratings. Some high-priced products appear as outliers with lower popularity.

3. Key Insights

Insight 1 – Top Product Categories

Storage organization and kitchenware categories contain the largest number of products in the dataset.

Insight 2 – Customer Ratings

Most products received ratings above 4, showing positive customer satisfaction.

Insight 3 – Price Distribution

The majority of products fall under low and medium pricing categories, while only a few products belong to premium price ranges.

Insight 4 – Outlier Detection

A few expensive products appear separately in the scatter plot, indicating premium products with limited availability or lower sales frequency.

Insight 5 – Price vs Rating Relationship

Higher product prices do not guarantee higher customer ratings. Product quality and usefulness may influence ratings more than price.

4. Business Recommendations

- IKEA can focus more on high-demand categories such as storage and kitchen products to improve sales performance.
- Premium products should be analyzed further to understand why they receive fewer interactions compared to affordable products.
- Since customers highly rate most products, IKEA can continue maintaining product quality standards.
- Marketing strategies can focus on medium-priced products because they attract a larger customer base.
- Customer feedback can be analyzed further to improve low-rated products.

5. Dashboard Story

1. The dashboard clearly explains the relationship between product categories, pricing, and customer ratings.
2. The KPI cards provide an overall summary of the dataset using total products, average price, and average rating.
3. The donut chart and bar chart show that certain categories dominate the IKEA product inventory.
4. The scatter plot helps identify product outliers and shows that expensive products are fewer in number and do not always achieve higher ratings.

5. The slicer allows interactive filtering of categories, helping users analyze specific product groups easily.
 6. Overall, the dashboard provides meaningful insights that help understand IKEA product trends, pricing behavior, and customer satisfaction patterns.
